**NANOPORE** Technologies

Before start checklist		
Materials	Consumables	Equipment
1 μg (or 100-200 fmol) amplicon DNA	■ NEBNext® Companion Module for Oxford Nanopore Technologies® Ligation Sequencing (NEB, E7180S or E7180L). Alternatively, you can use the NEBNext® products below:	Hula mixer (gentle rotator mixer)
Ligation Sequencing Kit (SQK-LSK112)	NEBNext Ultra II End repair/dA-tailing Module (NEB, E7546)	Magnetic rack, suitable for 1.5 ml Eppendorf tubes
	NEBNext Quick Ligation Module (NEB, E6056)	Microfuge
	1.5 ml Eppendorf DNA LoBind tubes	Vortex mixer
	0.2 ml thin-walled PCR tubes	Thermal cycler
	Nuclease-free water (e.g. ThermoFisher, AM9937)	C lce bucket with ice
	Freshly prepared 70% ethanol in nuclease- free water	
	_ Qubit™ Assay Tubes (Invitrogen, Q32856)	Qubit fluorometer (or equivalent for QC check)
	Qubit dsDNA HS Assay Kit (Invitrogen, Q32851)	Pipettes and pipette tips P2, P10, P20, P100, P200, P1000
INSTRUCTIONS		NOTES/OBSERVATIONS
DNA repair and end-prep		
Thaw DNA Control Sample (DCS) at RT, spin do	wn, mix by pipetting, and place on ice.	
Prepare the NEBNext Ultra II End Repair / dA-tailing instructions, and place on ice:	Module reagents in accordance with manufacturer's	3
Thaw all reagents on ice.		
Flick and/or invert the reagent tubes to ensure Note: Do not vortex the Ultra II End Prep Enzy		
$\square$ Always spin down tubes before opening for th	e first time each day.	
	recipitate. Allow the mixture to come to RT and pipel the precipitate, followed by vortexing the tube for 30	
IMPORTANT		
Do not vortex the NEBNext Ultra II End Prep Enz	ryme Mix.	
IMPORTANT		
It is important that the NEBNext Ultra II End Pre	p Reaction Buffer is mixed well by vortexing.

# Flow Cell Number: .....

INSTRUCTIONS	NOTES/OBSERVATIONS
<ul> <li>Prepare the DNA in Nuclease-free water:</li> <li>Transfer 100-200 fmol of amplicon DNA into a 1.5 ml Eppendorf DNA LoBind tube</li> <li>Adjust the volume to 49 µl with Nuclease-free water</li> <li>Mix thoroughly by pipetting up and down, or by flicking the tube</li> <li>Spin down briefly in a microfuge</li> </ul>	
In a 0.2 ml thin-walled PCR tube, mix the following: 1 µl DNA CS 49 µl DNA 7 µl Ultra II End-prep Reaction Buffer 3 µl Ultra II End-prep Enzyme Mix	
☐ Thoroughly mix the reaction by gently pipetting and briefly spinning down.	
Using a thermal cycler, incubate at 20°C for 5 minutes and 65°C for 5 minutes.	
Resuspend the AMPure XP Beads (AXP) by vortexing.	
Transfer the DNA sample to a clean 1.5 ml Eppendorf DNA LoBind tube.	
Add 60 µl of resuspended the AMPure XP Beads (AXP) to the end-prep reaction and mix by flicking the tube.	
Incubate on a Hula mixer (rotator mixer) for 5 minutes at RT.	
□ Prepare 500 µl of fresh 70% ethanol in Nuclease-free water.	
Spin down the sample and pellet on a magnet until supernatant is clear and colourless. Keep the tube on the magnet, and pipette off the supernatant.	
Keep the tube on the magnet and wash the beads with 200 µl of freshly prepared 70% ethanol without disturbing the pellet. Remove the ethanol using a pipette and discard.	
□ Repeat the previous step.	
Spin down and place the tube back on the magnet. Pipette off any residual ethanol. Allow to dry for ~30 seconds, but do not dry the pellet to the point of cracking.	
Remove the tube from the magnetic rack and resuspend the pellet in 61 µl Nuclease-free water. Incubate for 2 minutes at RT.	
Pellet the beads on a magnet until the eluate is clear and colourless, for at least 1 minute.	
$\Box$ Remove and retain 61 µl of eluate into a clean 1.5 ml Eppendorf DNA LoBind tube.	
Quantify 1 µl of eluted sample using a Qubit fluorometer.	
Take forward the repaired and end-prepped DNA into the adapter ligation step. However, at this point it is also possible to store the sample at 4°C overnight.

Flow Cell Number: .....

INSTRUCTIONS	NOTES/OBSERVATIONS
Remove the tube from the magnetic rack and resuspend the pellet in 15 µl Elution Buffer (EB). Spin down and incubate for 10 minutes at RT. For high molecular weight DNA, incubating at 37°C can improve the recovery of long fragments.	
Pellet the beads on a magnet until the eluate is clear and colourless, for at least 1 minute.	
Remove and retain 15 μl of eluate containing the DNA library into a clean 1.5 ml Eppendorf DNA LoBind tube.	
Quantify 1 µl of eluted sample using a Qubit fluorometer.	
The prepared library is used for loading into the flow cell. Store the library on ice or at 4°C until ready to load.	
IMPORTANT	
We recommend loading 5-10 fmol of this final prepared library onto your flow cells.	
Priming and loading the SpotON flow cell for GridION	
IMPORTANT	
□ The Kit 12 chemistry runs at 30°C on nanopore sequencing devices. This is several degrees cooler than other chemistries. While the protocol was initially developed on GridION and PromethION, we also support its use on MinION Mk1C, as the MinION Mk1C device's temperature control allows the flow cell to be maintained at 30°C for the duration of the run. However, we cannot guarantee the same level of temperature control on the MinION Mk1B. Therefore, if you are running Kit 12 chemistry on the MinION Mk1B, ensure that the ambient temperature does not exceed 23°C.	
Using the Loading Solution	
Thaw the Sequencing Buffer II (SBII), Loading Beads II (LBII) or Loading Solution (LS, if using), Flush Tether (FLT) and one tube of Flush Buffer (FB) at RT before mixing the reagents by vortexing and spin down at RT.	
To prepare the flow cell priming mix, add 30 μl of thawed and mixed Flush Tether (FLT) directly to the tube of thawed and mixed Flush Buffer (FB), and mix by vortexing at RT.	
Slide open the GridION lid and insert the flow cell.	
Slide the flow cell priming port cover clockwise to open the priming port.	
IMPORTANT	
Take care when drawing back buffer from the flow cell. Do not remove more than 20-30 µl, and make sure that the array of pores are covered by buffer at all times. Introducing air bubbles into the array can irreversibly damage pores.

Oxford NANOPORE Technologies

NA Samples:
-------------

INSTRUCTIONS	NOTES/OBSERVATIONS
After opening the priming port, check for a small air bubble under the cover. Draw back a small volume to remove any bubbles:    Set a P1000 pipette to 200 µl  Insert the tip into the priming port  Turn the wheel until the dial shows 220-230 µl, to draw back 20-30 µl, or until you can see a small volume of buffer entering the pipette tip Note: Visually check that there is continuous buffer from the priming port across the sensor array.  Load 800 µl of the priming mix into the flow cell via the priming port, avoiding the introduction of air	
bubbles. Wait for five minutes. During this time, prepare the library for loading by following the steps below.	
Thoroughly mix the contents of the Loading Beads II (LBII) by pipetting.	
IMPORTANT           The Loading Beads II (LBII) tube contains a suspension of beads. These beads settle very quickly. It is vital that they are mixed immediately before use.	
In a new tube, prepare the library for loading as follows: 37.5 μl Sequencing Buffer II (SBI) 25.5 μl Loading Beads II (LBII) mixed immediately before use, or Loading Solution (LS), if using 12 μl DNA library	
<ul> <li>Complete the flow cell priming:</li> <li>Gently lift the SpotON sample port cover to make the SpotON sample port accessible.</li> <li>Load 200 µl of the priming mix into the flow cell priming port (not the SpotON sample port), avoiding the introduction of air bubbles.</li> </ul>	
$\square$ Mix the prepared library gently by pipetting up and down just prior to loading.	
Add 75 µl of the prepared library to the flow cell via the SpotON sample port in a dropwise fashion. Ensure each drop flows into the port before adding the next.	
Gently replace the SpotON sample port cover, making sure the bung enters the SpotON port and close the priming port.	
IMPORTANT	
Install the light shield on your flow cell as soon as library has been loaded for optimal sequencing output.	
<ul> <li>Place the light shield onto the flow cell, as follows:</li> <li>Carefully place the leading edge of the light shield against the clip. Note: Do not force the light shield underneath the clip.</li> <li>Gently lower the light shield onto the flow cell. The light shield should sit around the SpotON cover, covering the entire top section of the flow cell.</li> </ul>	
Close the device lid and set up a sequencing run on MinKNOW.

INSTRUCTIONS	NOTES/OBSERVATIONS
Flow cell reuse and returns	
After your sequencing experiment is complete, if you would like to reuse the flow cell, please follow the Flow Cell Wash Kit protocol and store the washed flow cell at 2-8°C.	
Alternatively, follow the returns procedure to flush out the flow cell ready to send back to Oxford Nanopore.	
IMPORTANT	
If you encounter issues or have questions about your sequencing experiment, please refer to the Troubleshooting Guide that can be found in the online version of this protocol.
